

SUSTAINABILITY

"At Custom Equipment, big benefits are standard features. Through constant innovation, we aim to exceed expectations and create lifts that are sustainable both for the jobsite and the environment."

INCREASE YOUR EFFICIENCY

Engineered with the demands of the jobsite in mind, our lifts have unparalleled low floor-loading pressures that let you complete projects faster and more efficiently than others in the scissor lifts industry. Hy-Brid Lifts are your light-weight solution that will let you increase your bottom line and provide cost and resource savings by allowing you to:

- Operate on freshly-poured cement sooner
- Work on delicate or sensitive flooring without damage
- Easily navigate areas typically inaccessible by larger machines
- Decrease your project's lead time and overall project costs, and win more bids

REDUCE YOUR CARBON FOOTPRINT

Our lifts are all electric, which means they can be operated without producing harmful fossil fuel by-products. Because our lifts require only two 12V batteries versus four 6V, consumable parts and raw material use is reduced: since 50% fewer batteries need to be replaced and manufactured for our lifts, disposal of non-biodegradable components is significantly reduced.

DECREASE YOUR ENERGY USAGE

Our energy-effective lift design allows our lifts one of the longest single-charge runtimes in the scissor lift industry of up to sixteen hours, allowing you to achieve a longer battery life- per-charge cycle and extending your overall productivity. Two 12V batteries (versus four 6V batteries used by the leading brands) mean less energy is required per charge. This saves you time and reduces your energy consumption without sacrificing performance.

SAVE OUR NATURAL RESOURCES

Hy-Brid Lift components are almost completely recyclable, and are designed and manufactured in the USA using the highest standards available. These qualities, plus the high durability of our Hy-Brid Lifts mean they not only require fewer replacement parts and raw materials, but also boast a longer useable lifespan. This has led to lower maintenance costs over the life of our lifts compared to others in the industry.

Let us help you cut down on raw material consumption, save our natural resources, and advance your sustainability with Hy-Brid Lifts.
